Abstract

[0072] A method for printing images. A plurality of proof sheets having a thumbnail representation of at least some of the images, and at least one user-markable field indicative of at least one corresponding image when marked are printed. User-marked ones of the proof sheets are optically scanned to detect marked ones of the at least one user-markable field. The marked fields are processed to determine at least one selected image associated with each scanned proof sheet. At least one selected image is printed after the user-marked proof sheets have been scanned.
